Motivation

Non-linear classification and use more than 5000 features, so sigmoid function g will be complicated.

⇒ Complex

Computer vision problem:

- A car is a matrix for a computer.
- For a car, look and store specific pixels.
- Give the algorithm a list of car images so it learns what is a car.
- A pixel is feature so the calculation will be complex.

Neural network:

- Algorithm trying to mimic the brain
- 80'

Neural networks

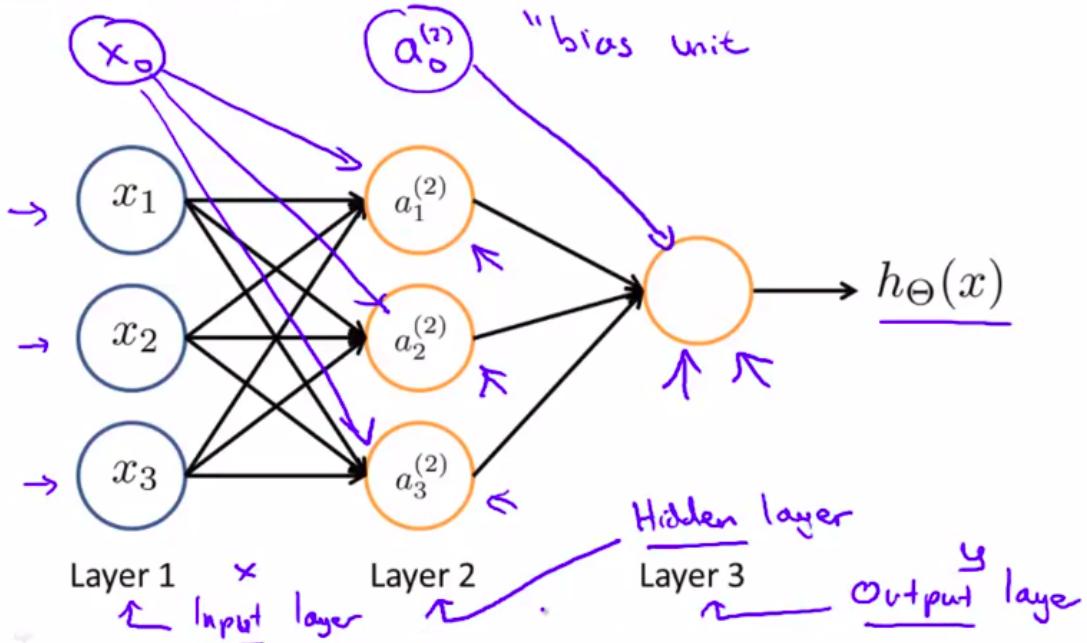

Neuron model: Logistic unit

$x_0, x_1, x_2, x_3 \Rightarrow [wires] \Rightarrow h_\theta(x); x_0 = 1$ bias unit

$$h_\theta(x) = \frac{1}{1+e^{-\theta^T x}} \quad x = \begin{bmatrix} x_0 \\ x_1 \\ x_2 \\ x_3 \end{bmatrix} \quad \theta = \begin{bmatrix} \theta_0 \\ \theta_1 \\ \theta_2 \\ \theta_3 \end{bmatrix}$$

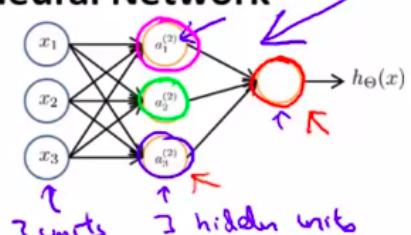

sigmoid (logistic) activation function $g(z) = \frac{1}{1+e^{-z}}$

Neural Network

Andrew Ng

Neural Network

$\rightarrow a_i^{(j)}$ = "activation" of unit i in layer j

$\rightarrow \Theta^{(j)}$ = matrix of weights controlling function mapping from layer j to layer $j + 1$

$$h_{\Theta}(x)$$

$$\rightarrow a_1^{(2)} = g(\Theta_{10}^{(1)} x_0 + \Theta_{11}^{(1)} x_1 + \Theta_{12}^{(1)} x_2 + \Theta_{13}^{(1)} x_3)$$

$$\rightarrow a_2^{(2)} = g(\Theta_{20}^{(1)} x_0 + \Theta_{21}^{(1)} x_1 + \Theta_{22}^{(1)} x_2 + \Theta_{23}^{(1)} x_3)$$

$$\rightarrow a_3^{(2)} = g(\Theta_{30}^{(1)} x_0 + \Theta_{31}^{(1)} x_1 + \Theta_{32}^{(1)} x_2 + \Theta_{33}^{(1)} x_3)$$

$$\rightarrow h_{\Theta}(x) = a_1^{(3)} = g(\Theta_{10}^{(2)} a_0^{(2)} + \Theta_{11}^{(2)} a_1^{(2)} + \Theta_{12}^{(2)} a_2^{(2)} + \Theta_{13}^{(2)} a_3^{(2)})$$

If network has s_j units in layer j , s_{j+1} units in layer $j + 1$, then $\Theta^{(j)}$ will be of dimension $s_{j+1} \times (s_j + 1)$.

$$s_{j+1} \times (s_j + 1)$$

Andrew Ng

$\Theta^{(j)}$ = matrix of weights controlling function mapping from layer j to layer $j + 1$

$a_i^{(j)}$ = "activation" of unit i in layer j

This is saying that we compute our activation nodes by using a 3×4 matrix of parameters.

$$a_1^{(2)} = g(\Theta_{10}^{(1)} x_0 + \Theta_{11}^{(1)} x_1 + \Theta_{12}^{(1)} x_2 + \Theta_{13}^{(1)} x_3)$$

$$a_2^{(2)} = g(\Theta_{20}^{(1)} x_0 + \Theta_{21}^{(1)} x_1 + \Theta_{22}^{(1)} x_2 + \Theta_{23}^{(1)} x_3)$$

$$a_3^{(2)} = g(\Theta_{30}^{(1)} x_0 + \Theta_{31}^{(1)} x_1 + \Theta_{32}^{(1)} x_2 + \Theta_{33}^{(1)} x_3)$$

$$h_{\Theta}(x) = a_1^{(3)} = g(\Theta_{10}^{(2)} a_0^{(2)} + \Theta_{11}^{(2)} a_1^{(2)} + \Theta_{12}^{(2)} a_2^{(2)} + \Theta_{13}^{(2)} a_3^{(2)})$$

Example: If layer 1 has 2 input nodes and layer 2 has 4 activation nodes. Dimension of $\Theta^{(1)}$ is going to be 4×3 where $s_j = 2$ and $s_{j+1} = 4$, so $s_{j+1} \times (s_j + 1) = 4 \times 3$

Forward Propagation: Vectorized implementation

$$a_1^{(2)} = g(z_1^{(2)})$$

$$a_2^{(2)} = g(z_2^{(2)})$$

$$a_3^{(2)} = g(z_3^{(2)})$$

$$z^{(2)} = \begin{bmatrix} z_1^{(2)} \\ z_2^{(2)} \\ z_3^{(2)} \end{bmatrix}$$

$$z^{(2)} = \Theta^{(1)} a^{(1)}$$

$$a^{(2)} = g(z^{(2)})$$

$$\text{Add } a_0^{(2)} = 1$$

$$z^{(3)} = \Theta^{(2)} a^{(2)}$$

$$h_{\Theta}(x) = a^{(3)} = g(z^{(3)})$$

Example

$$a(2) = ?$$

$$z(2) = \Theta(1)a(1); a(2) = g(z(2))$$

Summary

$$z^{(j)} = \Theta^{(j-1)} a^{(j-1)}$$

$$a^{(j)} = g(z^{(j)})$$

$$h_{\Theta}(x) = a^{(j+1)} = g(z^{(j+1)})$$

Applications

- AND; $x_1, x_2 \in \{0, 1\}; y = x_1 \text{ AND } x_2$

$$\text{Graph: } \begin{bmatrix} x_0 \\ x_1 \\ x_2 \\ x_3 \end{bmatrix} \rightarrow g(z^{(2)}) \rightarrow h_{\Theta}(x)$$

$$\Theta^{(1)} = [-30 \quad 20 \quad 20]$$

$$h_{\Theta}(x) = g(\Theta_{10}^{(1)} + \Theta_{11}^{(1)} + \Theta_{12}^{(1)}) = g(-30 + 20x_1 + 20x_2)$$

$$g(z) = \underline{\quad}/\!\!\!\underline{\quad}$$

| x_1 | x_2 | y |
|-------|-------|--------------|
| 0 | 0 | $g(-30) = 0$ |
| 0 | 1 | $g(-10) = 0$ |
| 1 | 0 | $g(-10) = 0$ |
| 1 | 1 | $g(10) = 1$ |

$$AND \Rightarrow \Theta^{(1)} = [-30 \quad 20 \quad 20]$$

$$OR \Rightarrow \Theta^{(1)} = [-10 \quad 20 \quad 20]$$

$$NOTx_1 \text{ AND } NOTx_2 \Rightarrow \Theta^{(1)} = [10 \quad -20 \quad -20]$$

$$NOR \Rightarrow \Theta^{(1)} = [10 \quad -20 \quad -20]$$

XNOR

Graph: $\begin{bmatrix} x_0 \\ x_1 \\ x_3 \end{bmatrix} \rightarrow \begin{bmatrix} a_1^{(2)} \\ a_2^{(2)} \end{bmatrix} \rightarrow [a^{(3)}] \rightarrow h_{\Theta}(x)$

For the transition between the first and second layer, we'll use a $\Theta^{(1)}$ matrix that combines the values for AND and NOR:

$$\Theta^{(1)} = \begin{bmatrix} -30 & 20 & 20 \\ 10 & -20 & -20 \end{bmatrix}$$

For the transition between the second and third layer, we'll use a $\Theta^{(2)}$ matrix that uses the value for OR:

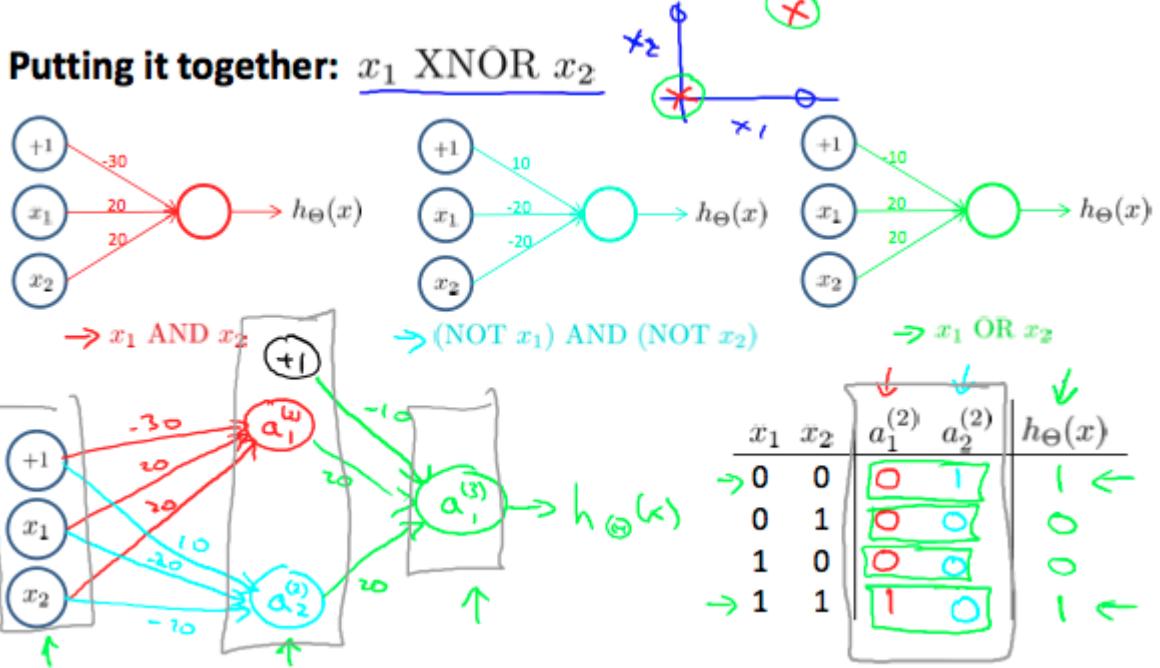

$$\Theta^{(2)} = [-10 \quad 20 \quad 20]$$

Values for all our nodes:

$$a^{(2)} = g(\Theta(1). x)$$

$$a^{(3)} = g(\Theta(2). a^{(2)})$$

$$h_{\Theta}(x) = a^{(3)}$$

Multiclass Classification

To classify data into multiple classes, we let our hypothesis function return a vector of values.

If it is class C1 return $\begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$

We can define our set of resulting classes as y . Each $y^{(i)}$ represents a different image corresponding to either a car, pedestrian, truck, or motorcycle.

The inner layers, each provide us with some new information which leads to our final hypothesis function. The setup looks like:

$$\begin{bmatrix} x_0 \\ \dots \\ x_n \end{bmatrix} \rightarrow \begin{bmatrix} a_1^2 \\ a_0^2 \\ \dots \end{bmatrix} \rightarrow \dots \rightarrow \begin{bmatrix} h_\Theta(x)_1 \\ \dots \\ h_\Theta(x)_4 \end{bmatrix}$$
